Ideation Phase
Empathize & Discover

Date	31 January 2026
Team ID	0827CY231062
Project Name	Health360: Executive Analytics & Population Health Dashboard
Maximum Marks	4 Marks

Empathy Map Canvas:
An empathy map is a simple, easy-to-digest visual that captures knowledge about a user's behaviors and attitudes.
It is a useful tool to helps teams better understand their users.
Creating an effective solution requires understanding the true problem and the person who is experiencing it.
The exercise of creating the map helps participants consider things from the user's perspective along with his or her goals and challenges.

SAYS

- "We have over 5,000 patient records, but extracting immediate clinical insights takes far too long."
- "I need to see how vital sign spikes like Blood Pressure and Cholesterol correlate directly with overall patient risk."
- "Our team needs dynamic cross-filtering so we can analyze specific cohorts, like Seniors or Obese patients, with a single click."

THINKS

- Are high-risk cardiovascular patients being identified early enough for preventive intervention?
- How heavily are lifestyle factors like smoking, physical inactivity, and alcohol consumption driving our chronic disease numbers?
- We need an intuitive executive dashboard that bridges clinical vitals, lifestyle habits, and population demographics.

PERSON A NAME:

Dr. Michael Carter

DOES

- Reviews weekly population health reports across chronic conditions (Diabetes, Heart Disease, Stroke).
- Cross-examines patient vitals against behavioral factors to design clinical care protocols.
- Interacts with visual dashboard reports, filtering by age categories (Children to Elder) and risk categories to guide resource allocation.

FEELS

- **Frustrated** when navigating static, disconnected spreadsheet reports that obscure critical patient risk correlations.
- **Anxious** about missing early warning markers in high-risk patients across the 5,000-patient cohort.
- **Empowered & Confident** when utilizing a responsive, interactive dashboard that delivers real-time risk stratification.

SAYS

- "We need clear visibility into how physical inactivity, smoking, and alcohol usage combine to increase health risks."
- "Static data doesn't tell us which specific age groups need targeted wellness interventions first."
- "I want to track how average BMI changes across activity levels—from Sedentary to Active."

THINKS

- *Which lifestyle combinations trigger the sharpest spike in overall composite risk scores?*
- *Are our wellness programs effectively reaching middle-aged and senior populations who are sedentary?*
- *How can we encourage high-risk lifestyle groups to adopt preventative habits before chronic diseases develop?*

PERSON A NAME:

Emily Rodriguez

DOES

- Analyzes lifestyle heatmaps cross-tabulating exercise, smoking, and alcohol habits against risk scores.
- Compares body mass index (BMI) distributions across different physical activity brackets.
- Designs targeted health initiatives and wellness intervention campaigns for high-risk lifestyle segments.

FEELS

- **Overwhelmed** by raw, unorganized lifestyle datasets that make habit correlations hard to uncover.
- **Driven** to build effective preventative wellness strategies that keep patients out of high-risk brackets.
- **Reassured** when using multi-factor heatmaps that visually pinpoint behavioral risk drivers in seconds.

SAYS

- "We need a clear demographic breakdown of our 5,000-patient cohort across all life stages."
- "It's essential to monitor symptom frequencies like Chest Pain, Dizziness, and Fatigue across age cohorts."
- "Resource allocation depends heavily on knowing weight distributions and disease prevalence per age group."

THINKS

- *How are chronic condition burdens distributed from Young Adults all the way to Elders?*
- *Which age categories are exhibiting the highest rates of acute symptoms requiring specialized care facilities?*
- *Are our population health resources appropriately aligned with demographic demand?*

PERSONA NAME:

Dr. Priya Nair

DOES

- Evaluates population pyramids and age/gender distributions across all six age brackets (Children to Elder).
- Tracks population-wide weight stratifications across Normal, Overweight, Obese, and Underweight categories.
- Monitors symptom frequency counts to optimize healthcare staffing and facility resource planning.

FEELS

- **Challenged** by managing healthcare allocation across diverse age groups without clear visual demographic filters.
- **Proactive** about detecting population-level trends before healthcare facilities face capacity overloads.
- **Empowered** when analyzing interactive demographic charts and symptom frequency summaries.
