Story

Date	24 September 2024
Team ID	
Project Name	Health360: Executive Analytics & Population Health Dashboard
Maximum Marks	5 Marks

By using stories in Tableau, you can effectively communicate complex data in a way that is both interactive and engaging, making it easier for the audience to follow along and understand the insights. It's a tool for **data storytelling**, allowing you to present insights in a cohesive, engaging way that takes viewers through a logical progression of findings or analyses.

In Tableau, **Story** is a feature that allows you to create a sequence of dashboards, visualizations, and text to present data insights in a cohesive and narrative-driven way. It's like a slideshow within Tableau that guides the audience through a series of data points, helping them understand key insights, trends, or outcomes of your analysis.

Observations: 9-Point Executive Tableau Story Narrative

The **Health360 Executive Story** organizes the analytical workflow into a 9-point guided narrative, walking executive decision makers through population baselines, clinical correlations, behavioural risk drivers, and demographic stratifications:

1. **Executive KPI Baseline:** The 5,000-patient population presents an average risk score of **1.57**, with **3,798 patients** classified as high risk and a **36% chronic condition prevalence rate** requiring structured population health interventions.

2. **Vitals & Risk Correlation:** Blood pressure readings exceeding **140 mmHg** combined with cholesterol levels above **220 mg/dL** show a strong correlation with maximum calculated risk scores (**5.0**), highlighting critical cardiovascular intervention zones for Dr. Michael Carter.

3. **Chronic Condition Load:** Diabetes is the most widespread chronic condition (**660 patients** in normal BMI, **580** in overweight), followed by heart disease (**550 patients** in overweight) and Stroke (**481 patients** in normal BMI), demanding targeted chronic care management programs.

4. **Substance Co-occurrence Risks:** Smoking status and alcohol consumption cross-tabulation across age categories shows significant behavioural stacking, with high substance use prevalent across **Adult** and **Middle-Aged** cohorts.

5. **BMI & Physical Activity Dynamics:** Average BMI remains consistently elevated (**24.5 to 25.3**) across sedentary, moderate, and active groups, showing that physical activity alone must be paired with nutritional management to shift weight classifications.

6. **Compounding Behavioural Risk Matrix:** The lifestyle heatmap proves that active smokers who drink alcohol exhibit elevated risk scores (**2.06 to 2.17**) regardless of exercise levels, confirming lifestyle co-factors as primary risk multipliers for Emily Rodriguez.

7. **Demographic Care Demand:** Patient volume peaks in the **Middle Age** (613 females, 588 males) and **Senior** (612 females, 606 males) categories, establishing these two age groups as the primary consumers of healthcare services for Dr. Priya Nair.

8. **Population Weight Breakdown:** Nearly half of the entire patient cohort (**49.48%**) carries unhealthy weight classifications (**33.42% Overweight**, **16.06% Obese**), emphasizing the need for system-wide wellness and preventive metabolic initiatives.

9. **Symptom Prevalence Patterns:** Acute symptoms like Chest Pain (**637 in Adults**, **619 in Seniors**) and Fatigue (**634 in Adults**, **617 in Seniors**) peak sharply during middle and later life stages, serving as key operational predictors for emergency and outpatient staffing.
